

TL46-W-815 Product Enhancement

Datasensor UK is pleased to announce a very important change to the basic TL46-W model. Reflecting the merger with Datalogic Automation, the TL46 range has been re-styled in the new Datalogic colour scheme, which is gradually being incorporated into all of the sensing products that previously carried the Datasensor livery. This presented us with the opportunity to upgrade the setting up procedure to mirror that of the very popular TL4, using separate dedicated 'mark' and 'background' buttons as many of you have requested but with the benefit of RGB (red, green, blue) emission.

Important notes:

- The ordering codes for the improved models remain unchanged.
- The new versions are already in our UK stock and are available for immediate delivery.
- This improvement will simplify and speed up the setting procedure of the contrast sensor.

Please see below a link to the new user manual, where you will find the updated setting procedure.
